# CS 480: Project Presentation Instructions

Each team submits one project presentation slide, which is worth 15% of your overall grade. This document specifies what information you should include in your slides.

## Slide contents (6-8 slides)

Your slides should be 6-8 pages (excluding references). Consider using the following section structure, though you can use a different structure.

**Key information.** Your slide should have the following information in the title page:

- **Title**: The title of your project.
- **Team member names**: List the names of all of your team members.

**Abstract.** An abstract should concisely (less than 300 words) motivate the problem, describe your aims, describe your contribution, and highlight your main findings (s).

**Introduction.** The introduction explains the problem, why it's difficult, interesting, or important, how and why current methods succeed/fail at the problem, and explains the key ideas of your approach and results. Though an introduction covers similar material as an abstract, the introduction gives more space for motivation, detail, references to existing work, and to capture the reader's interest.

**Related work.** This section helps the reader understand the research context of your work, by providing an overview of existing work in the area.

- You might discuss: papers that inspired your approach, papers that you use as baselines, papers proposing alternative approaches to the problem, papers applying your methods to different tasks, etc.

**Approach.** This section details your approach(es) to the problem. For example, this is where you describe the architecture of your neural network(s), and any other key methods or algorithms.

- You should be specific when describing your main approaches – you probably want to include equations and figures.

**Experiments.** This section contains the following.

- **Data**: Describe the dataset(s) you are using (provide references). If it's not already clear, make sure the associated task is clearly described. Being

precise about the exact form of the input and output can be very useful for readers attempting to understand your work, especially if you've defined your own task.

- **Evaluation method**: Describe the evaluation metric(s) you use, plus any other details necessary to understand your evaluation. Some projects will have clear metrics from prior work on given datasets, but we realize that other projects will define their own metrics. If you're defining your own metrics, be clear as to what you're hoping to measure with each evaluation method (whether quantitative or qualitative, automatic or human-defined!), and how it's defined.
- **Experimental details**: Report how you ran your experiments (e.g. model configurations, learning rate, training time, etc.)
- **Results**: Report the quantitative results that you have found so far. Use a table or plot to compare results and compare against baselines. [3]
  - If you're a default project team, you should **report the F1 and EM scores you obtained on the test leaderboard** in this section. Make it clear whether you are on the IID SQuAD track or the RobustQA track. You can also report dev set results if you like.
  - Comment on your quantitative results. Are they what you expected? Better than you expected? Worse than you expected? Why do you think that is? What does that tell you about your approach?

**Conclusion.** Summarize the main findings of your project and what you have learnt. Highlight your achievements, and note the primary limitations of your work. If you like, you can describe avenues for future work.

**References.** Your references section should be produced using BibTeX.
